Tabs® fall management

Resident falls are a major concern for all senior care facilities. The integration of RoamAlert with Tabs fall monitors gives you the benefits of both systems. Tabs is Stanley's premier fall monitor, and can be used to monitor residents in beds, chairs or rooms.

Four models to choose from

There are four Tabs monitors to choose from, with a wealth of options to give you the solution you need for each resident and each room.

Tabs Basic Straightforward pull cord protection with a local sound alarm.

Tabs Select Monitor both a pull cord and a pressure pad, with the option of integration with RoamAlert and/or your nurse call system.

Tabs Professional All the features of Tabs Select, plus the voice feature: record a short message that plays when the resident attempts to get up, encouraging them to call for assistance.

Tabs Elite Built for even greater durability, the Elite model features all-metal construction, and for greater flexibility comes complete with nurse call interface, AC power adaptor, and bed mounting bracket.

Tabs Professional

Easy to install and use

The Tabs monitor attaches quickly to any bed, wheelchair or wall with a variety of brackets, and can be easily moved from bed to wheelchair to toilet.

It's also very easy to use. Just connect the pull cord or pressure pad, and the monitor is ready to go. Alarms are indicated by a loud alarm tone; the Select and Professional models have four different alarm tones so that you can quickly distinguish between different residents. Or, you can choose to make alarms completely silent, and have all reporting through the RoamAlert system or your nurse call system (see below for details).

Resetting an alarm is just as easy. Depending on your model, just reinsert the pull cord, or sit the resident back down.

Integrate with RoamAlert

The Tabs Select, Professional and Elite models can be integrated into the RoamAlert system. An InterTag is connected to the Tabs monitor, enabling you to receive alarms from anywhere in your facility, even if the monitor is on the move on a wheelchair.*

Integration with the RoamAlert system brings several advantages. Alarms are displayed in the RoamAlert software with complete information on the device and location. The software keeps a record of all events, allowing clinical and nursing staff to regularly review the resident's risk for falls. Maintenance staff can also use the system to find and undertake maintenance on the Tabs unit.

For residents, you can create a more peaceful and home-like environment. Because alarms are being monitored centrally and sent out automatically to staff via pager, you can turn off the sound alarm on the Tabs monitor. (The voice feature on the Professional model remains active, to encourage the resident to sit or lie back down.)

Alternatively, you can connect the Tabs monitor to your nurse call system to receive remote notification. The information available will depend on the abilities of the nurse call system.

RoamAlert receivers are required for this application.
